GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF70 corresponding to residues 34-174. This fragment is devoid of the trans-membrane and cell wall anchor regions. It is useful in vaccine composition.
           The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus. Antibodies against GRAB are useful for purifying alpha2M from a sample. The present sequence is one of the repeat regions of GRAB protein from S. pyogenes strain S7370 corresponding to residues 92-119. This fragment is useful in vaccine composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,
                                                                                                                                                                                                                                                                                                                     Gaps

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. Pyogenes strain API.

The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus. Phythogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding for residues 34-192 and devoid of the membrane spanning region. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                           New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GRAB protein; protein G related alpha2M binding protein; vaccine; alpha2-macroglobulin; group A Streptococcus; GAS; antibiotic; immune response; Streptococcus pyogenes infection.

immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain KTL3.

The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                                                                                       The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                             The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a mature GRAB protein from S. Pyogenes strain SF370 without the signal sequence. This sequence is capable of binding alpha2M
                                                                                                                                                                                              New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus, Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a full-length GRAB protein from S. pyogenes strain SF370.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,\cdot\,

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain AP49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytoplasmic; vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis;

                                                                                                                                                                                                        The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain KTL9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein

acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coll hosts.

222 AA;

Sequence

```
This sequence represents a H. pylori secreted or periplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as petential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (AFCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORPs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least for treating or proteins are claimed, as are probes containing at least for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of the licobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.

```
alkaline phosphatase (BAP) that has higher activity and similar thermal stability compared with the corresponding wild-type E.coli BAP. In this mutein, one wild-type amino acid residue has been substituted (see features table). Optionally, at least one amino acid is inserted between residues 6 (Pro) and 7 (Val) of the wild-type enzyme. The modified enzyme is useful as an immunoassay label. Note: This sequence does not appear in the specification but has been derived by modifying an E.coli BAP sequence according to the numbering given in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a specifically claimed modified bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a dood supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating and disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                    Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                             AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venerallymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                             Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention provides a number of nucleotide and protein arequences from the Coryneform bacterium Corynebacterium glutualcum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, tramins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                   Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Caps

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of

                                                                                                                                                                                                                                                                                                                     ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human brain expressed single exon probe encoded protein SEQ ID NO: 36372.
                                                                                                                                           measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human: brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia;

                                                                                   probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                       The present invention provides a number of single exon nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                          Peptide #11249 encoded by probe for measuring placental gene expression.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella preumoniae, Bseudomonas aeruginosa and Enterococcus facefalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic

genes essential to

```
prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes, their use in the discovery of novel antibiotics, the essential genes, their use in the discovery of novel antibiotics, the essential case themselves and the encoded proteins. The prokaryotes used are been contained as a sequence in the identification of potential new targets of invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen to a wide variety of organisms. The present sequence is also useful to screen a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Calcium/calmodulin dependent protein kinase; CaMK-VI; CaMK-IV; CaMK VI related peptide; CARR; neuronal plastitity; eplicpsy; kainate-induced seizure; selzure; central nervous system; hippocampus; acute brain insult; stroke; trauma; hypoxia; ischemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A rat calcium/calmodulin dependent protein kinase designated CaMK-IV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "residue thought to be crucial for activation of the kinase by phosphorylation"
                                                                                                                                                                                                                                                           New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins. The prokaryotes used are convention is also useful for the identification of potential mew targets for antibiotic development. The antisense nucleic acids can also be used invention is also useful for the identification of potential mew targets for antibiotic development. The antisense nucleic acids can also be used to indentify proteins used in proliferation, to expresse proteins.

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forms this wipe.int/pub/published_pct_sequences.

This sequence represents the amino acid sequence of the mouse p/CIP (p300/CBP/co-integrator-associated protein) polypeptide. The protein can regulate gene expression so are potentially useful therapeutically, e.g. aqainst (breast) cancer, Inflammatory disease (e.g. atherosclerosis)
                                                                    "there appears to be 20 amino acids missing
between these positions in the sequence given
in the specification"
                               between these positions in the sequence given
                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding p/\text{CIP} and NcoA-2 polypeptides - are used to identify agents that regulate gene expression, e.g. for treatment of cancer, inflammatory disease and osteoporosis
               /note= "there appears to be 20 amino acids missing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AIB1; amplified in breast cancer; cancer; steroid; receptor; coactivator; SCR; estrogen; ER; estrogen dependent transcription; breast cancer; lung cancer; colon cancer; prostate cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1402

                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a calcium/calmodulin dependent protein kinase (CaMK-IV). The specification also describes another CaMK designated CaMK-IV). The specification also describes another CaMK campared CaMF or campared peptide, designated CAMF. The CAMF peptide is produced by alternative splicing of the CaMF-VI gene, and plays a role in kinase-mediated neuronal plasticity which is associated with epilepsy. A large part of CAMF (48 out of 55 amino acids) is highly homologous with the carboxy-terminus of human doublecortin. It is possible the calcium overload in a cell, triggered by kainate-induced seizures, leads to activation of CaMK-VI. This acts as a modulator of the kinase, e.g. by acting as a substrate or by irreversible binding to the activated kinase. The mammalian CAMF protein may be used for the treatment and/or prevention of seizures
                                                                                                                                                                                                                                                     Mammalian calcium/calmodulin dependent protein kinase related protein useful as a modulator of calcium/calmodulin dependent protein kinase activity, useful for treating seizures and damage to the central
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     portion may no again and or damage to the central nervous system, particularly the hippocampus. CARP peptides may also be used to treat acute brain insults (e.g. resulting from stroke, trauma, hypoxia, and ischemia), and neurodegenerative diseases (e.g. Alzheimer's disease).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                     (SCR-I) family of nuclear receptor co-activators that interact with cestrogen receptors (ER) to enhance ER-dependent transcription.

The AIBI gene is amplified and over-expressed in certain cancers in particular breast cancer and steroid hormone responsive cancers.

The AIBI polypeptide can be used to identify compounds which inhibit ER-dependent transcription. Increased expression of the AIBI gene indicates aberrantly proliferating cells, thus detection of increased expression of the AIBI gene or an increase in the number of copies of the AIBI gene can be used to disgnose cancer or a predisposition towards developing cancer. Compounds which inhibit expression of AIBI or compounds which inhibit interaction of AIBI with steroid receptors or nuclear co-factors can be used for reducing the proliferation of cancer cells. This sequence is of the murline pcIP protein, mouse ortholog of AIBI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                             New isolated steroid receptor co-activator, AIB1 - used to develop products for the diagnosis and treatment of steroid-responsive tumours, e.g. breast, lung, prostate or colon cancers or melanomas
                                                                                                                                                                                                                       The AIB1 protein is a member of the steroid receptor coactivator-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABL16176-ABL30511), expressed DNA (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the native RSP3 protein, a Chlamydomonas pf14 gene product. The gene can be tagged by using the method of invention of tagging genes, transcripts and proteins in cells in a single recombinational event. The method comprises producing a tagged gene by inserting a DNA sequence into an intron of a gene by selecting a DNA sequence having a 5, portion free of any nucleotide sequence selected from AAV43548 to AAV43551, a
                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tagged gene; tagged transcript; hybrid intron; protein tag; protein isolation; recombination; subcellular structure analysis; transcriptional regulation; viral infection; Chlamydomonas; pf14 gene.

runction of proteins. The products, methods and uses are particularly used for proteins that are unstable, are difficult to purify, or share epitopes with a number of other proteins. The methods overcome the inefficiency of epitope tagging caused by reading frame obstacles and orientation obstacles.

                                                     splice acceptor site in a known gene, sequence identical to a known splice donor site in a known gene, an open reading frame (ORF) 3N-1 nucleotides in length, the ORF encoding a known peptide tag recognisable by a known reaction characteristic of the known peptide tag and sequences selected form CAGG and TAGG. The DNA sequence is inserted into the intro within the gene to create a tagged gene, and the tagged gene is incubated within a cell so as to maintain intact or to introduce the tagged gene within the genome of the cell. The method is used for isolating proteins, RNA and genes, for analysis of subcellular structures, cellular responses and transcriptional regulation, for the study of viral infection and for
nucleotide sequence selected from AAV43552 to AAV43560 and nucleotide sequences identical to a known spilce branch site in a known gene, sequences identical in length to a known spacer region between splice branch and acceptor sites in a known gene, sequences identical to a known

The tagged chlamydomonas protein RSP3 is an example of a target nuclectide with an oligonucleotide encoding an epitope inserted. The epitope is encoded by the oligonucleotides nucleotide sequence independently of the reading frame. The epitope and methods disclosed can be used for the tagging of genes, transcripts and polypeptides. They can be used for e.g. discovering new genes, determining the size and abundance of proteins produced by newly discovered genes, tracking the movement of proteins within cell membranes, monitoring receptor binding and internalisation of exogenous proteins, identifying the components of function of proteins complexes, purifying proteins, discovering the function of proteins. The products, methods and uses are particularly used for proteins that are unstable, are difficult to purify, or share epitopes with a number of other proteins. The methods overcome the inefficiency of epitope tagging caused by reading frame obstacles and

```

The Chlamydomonas protein RSP3 is an example of a target nucleotide sequence into which is inserted an oligonucleotide encoding an epitope. The epitope is encoded by the oligonucleotides nucleotide sequence independently of the reading frame. The epitope and methods disclosed can be used for the tagging of genes, transcripts and polypeptides. They can be used for e.g. discovering new genes, determining the size and abundance of proteins produced by newly discovered genes, tracking the movement of proteins within cell membranes, monitoring receptor binding and internalisation of exogenus proteins, identifying the components of functional protein complexes, purifying proteins, discovering the

- using an

Epitope tagging of genes, transcripts and polypeptides · using oligonucleotide comprising a nucleotide sequence encoding the epitope independently of the reading frame of the nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a tandem tagged RSP3 protein, a chlamydomonas pf14 gene product. The gene can be tagged by using the method of invention of tagging genes, transcripts and proteins in cells in a single recombinational event. The method comprises producing a tagged gene by inserting a DNA sequence into an intron of a gene by selecting a DNA sequence into an intron of a gene by selecting a bla sequence having a 5' portion free of any nucleotide sequence selected from AAV43562 to AAV43569, a nucleotide sequence selected from AAV43552 to AAV43560 and nucleotide sequences identical to a known gene, branch site in a known gene, sequences identical in length to a known sequences identical to a known splice acceptor sites in a known gene, sequence identical to a known splice acceptor site in a known gene, sequence identical to a known splice doceptor site in a known gene, sequence identical to a known splice doceptor site in a known gene, sequence identical to a known splice donor site in a known gene, neading frame (ORF) 3N-1 nucleotides in length, the ORF encoding a known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peptide tag recognisable by a known reaction characteristic of the known peptide tag and sequences selected form CAGG and TAGG. The DNA sequence is inserted into the intron within the gene to create a tagged gene, and the tagged gene is incubated within a cell so as to maintain intact or to introduce the tagged gene within the genome of the cell. The method is used for isolating proteins, RNA and genes, for analysis of subcellular structures, cellular responses and transcriptional regulation, for the study of viral infection and for diagnosis of

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quentitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAW88323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

```
The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein

can be useful in vaccines for inducing protective antibodies against

Streptococcus pneumoniae, for treatment or prevention of infection e.g.

pneumonia, otitis media or meningitis. Probes based on the nucleic acid

are used to detect Streptococcus infection (by usual hybridisation or

amplification methods), also for isolating Streptococcus genes or their

allelic variants. The protein can be used similarly to detect specific

antibodies in standard immunoasasys, especially for diagnosing or

monitoring infections. Antibodies which bind the protein are used to

detect corresponding antigans, to purify the protein and for passive

immunisation (optionally coupled to a toxin). Vaccines are administered,

e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces ruxii, saccharomyces huyveringes bayanus var. uvarum, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces Riuyveriomyces thermoclolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Varrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CNSO738M 1061 bp DNA linear GSS 07-JUL-2001 clone BA0AB017F12 of library BA0AB from strain CLIB 210 of Kluyveromyces lactis, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Souciet, J. /note="Vector: lambda Unizap XR; Site_1: EcoR I; Site_2: Xho I; Cutaneous filarial nematode parasite of humans. mRNA was prepared from third stage infective larvae of onchocerca volvulus isolated from mosquitoes 10 days after infection and converted to double stranded cDNA using reverse transcriptease and oligo(dr) followed by RNase H and DNApol I. The library had 1.8 x 10E5 independent recombinants and average insert size was 900 base pairs. The library was constructed by Wenhong Lu. The library is available from Br. S. Williams, email genome@smith.edu."
